visit QATAR

Integrated Visitor App

Confidential & Proprietary

The contents of this document are intended solely for the use of the Ministry of Communications and Information Technology. The use, duplication, or disclosure of the information is restricted to this purpose except were exempted by agreement in other places.

Classification: Internal - داخلي

1. Integrated Visitor App

1.1. Integrated Visitor App Workflow

AR Navigation & Wayfinding with POIs

A total of 7 steps summarizes this high-level AR user journey:

1. Browse & Select Destination: Open the “Itineraries” page in the Visit Qatar app, search for a venue, and save the stop
2. Receive a Proximity Alert for AR Navigation: Get push notification when the user is near their saved stop. The map opens with location preloaded
3. Load AR Navigation Mode: Once the user selects 'Navigate in AR', the phone's camera view opens with AR overlay loaded. The interface confirms the starting point and provides a miniature preview map of the intended route
4. Follow AR Guidance: Users follow dynamic AR elements such as directional arrows, animated paths, and floating markers projected onto their surroundings. Key points are labeled with floating text (e.g., 'Main Entrance', 'Gate 5', 'VIP Lounge')
5. User has the option to enable accessibility routing for wheelchairs, strollers, or mobility assistance. Selecting this option recalculates the AR path to avoid stairs, steep ramps, or narrow passages
6. Contextual Tips Along the Route: While following the route, the system displays pop-up tips relevant to the location ahead, such as 'Restrooms 50m ahead' or 'Upcoming Exhibit: Islamic Art'
7. Arrival Confirmation: Upon reaching the destination, the AR overlay transitions to a 'You Have Arrived' animation with possible links to additional features such as venue details or event schedules

A total of 9 steps summarizes this high-level AR backend journey:

1. Attach Event Details: Assign navigation experience to an event or permanent location (e.g., 'Doha Museum Opening'). Record details such as event name, type, start date, end date, and any special conditions
2. Define Geofence: Establish a precise GPS or indoor/outdoor mapping boundary that triggers the navigation feature when the user enters the designated zone (e.g., museum perimeter, airport terminal entry)
3. Define Points of Interest (POIs): Identify and log all key waypoints including entrances, main halls, restrooms, exhibit zones, ticket counters, elevators, and emergency exits. Ensure both indoor and outdoor points are marked
4. Add POI Metadata: For each POI, upload descriptions, images, accessibility tags (e.g., wheelchair accessible), and AR-related assets such as custom icons or 3D markers
5. Assign AR Interactions: Configure the behavior and appearance of AR elements, including directional arrows, animated navigation lines, floating markers, and pop-up text prompts

Classification: Internal - داخلي

6. Preview & Test: Simulate the navigation experience in a staging environment to check alignment of AR overlays with physical surroundings, verify accuracy of routes, and ensure accessibility mode functions correctly
7. Push to Live: Publish the verified navigation paths and AR content to the production environment for public access
8. Monitor Feedback & Adjust: Continuously collect visitor feedback and analyze route usage data to identify and fix unclear paths or improve AR marker placement
9. Dashboard Monitoring: Use backend analytics to track total users, most visited POIs, average navigation time, and completion rates for different routes

Gamified Tours Customized to the audience

A total of 7 steps summarizes this high-level AR user journey:

1. Choose Game Theme: User accesses the 'Gamified Tours' section and selects a themed experience such as 'F1 Racing Quest', 'Heritage Hunt', or 'Kids Treasure Trail'. Each theme includes a description, difficulty rating, and estimated completion time
2. Receive First Clue: AR overlay presents a challenge or riddle (e.g., 'Find the mosque with the tallest minaret in Qatar, a landmark blending tradition and architecture'). Clues may include visual hints or distance indicators
3. Hunt for Location: User moves around following AR guidance such as floating markers or arrows that appear progressively as they get closer to the target location
4. Scan Landmark: Upon arrival at the location, user scans the AR marker or object using their device camera to trigger an animation or unlock hidden content
5. Earn Rewards: Successful scans award points, virtual badges, or digital tickets issued through the integration with Visit Qatar's potential white-label Ticketing & Marketplace solution. Rewards may vary based on speed, accuracy, or difficulty of the challenge. All rewards earned here must transact through the centralized Visit Qatar Rewards Program ("Pearl Points") via the Digital Wallet Rewards Ecosystem to ensure unified tracking, redemption, and partner settlement
6. Get Next Challenge: Completion of one stage unlocks the next clue, increasing difficulty and complexity
7. Complete Tour & Redeem: After finishing all stages, user can redeem collected points for real-world rewards like event tickets issued through the integration with Visit Qatar's potential white-label Ticketing & Marketplace solution, discounts, or exclusive collectibles. All redemptions are processed through the Visit Qatar Rewards Program and Digital Wallet ecosystem, ensuring unified settlement, balance updates, and compliance with the broader rewards infrastructure

A total of 9 steps summarizes this high-level AR backend journey:

1. Attach Event Details: Define the game's theme, storyline, and activation window (e.g., 'Qatar GP Race Week Special Edition')
2. Define Geofence: Establish boundaries for the start location and each challenge stage
3. Define Points of Interest (POIs): Mark precise coordinates for all clue and challenge locations, ensuring both indoor and outdoor areas are covered

Classification: Internal - داخلي

4. Add POI Metadata: Upload detailed clue text, riddle hints, AR assets (e.g., floating objects, animated effects), and reward specifications for each stage
5. Assign AR Interactions: Configure how clues appear, how markers guide the player, and how animations or effects are triggered upon task completion
6. Preview & Test: Conduct full gameplay tests to ensure logical stage progression, marker visibility, accurate AR placement, and correct reward scoring
7. Push to Live: Launch the gamified tour in the app's 'Gamified Tours' section for public access
8. Monitor Feedback & Adjust: Refine clues, adjust difficulty, or refresh rewards based on player engagement and feedback
9. Dashboard Monitoring: Track player participation numbers, stage completion rates, time taken per stage, and reward redemption statistics

Digital Wallet Usage Steps

A total of 8 steps summarizes this high-level user journey:

1. Open Wallet: User launches the app and navigates to the wallet
2. Top-up & Balance View: Add QAR using card/wallet providers; wallet updates both QAR + points balances. Users can also request a refund of any unused cash balance to the original payment method used for top-up, in accordance with payment-gateway and KYC rules
3. Purchase Digital Pass: After topping up, buy a time-limited or unlimited pass that unlocks bundled access to multiple POIs, events, or services, paid via QAR, points, or Cash+Points
4. Automatic Earning: Earn points through eligible activities such as bookings, ticket scans, event attendance, and partner purchases, supported through the relevant integration interfaces, including the potential white-label Ticketing & Marketplace solution where applicable
5. Family & Group Earning: Transfer balances/points to family members or pooled wallets
6. Gamified Earning: Complete quests, streaks, mini-games, or geofenced missions to unlock bonus points, badges, or random perks. All earning events are processed through the centralized Visit Qatar Rewards Program ("Pearl Points") via the Digital Wallet Rewards Ecosystem to maintain a single ledger and partner settlement process
7. Content/Ambassador Rewards: Earn by creating or sharing approved content (posts, photos, campaigns). These rewards also flow through the same Rewards Ecosystem for consistency across modules
8. Confirmation: User sees points instantly reflected in wallet balance and progress toward loyalty tier upgrades. This confirmation is linked to the integrated Rewards Ecosystem to synchronize balances and tier progression in real time

A total of 8 steps summarizes this high-level backend journey:

1. Wallet Ledger: Record all top-ups, balances, transfers, and points accruals in real time

Classification: Internal - داخلي

2. Payment Gateway: Process secure QAR top-ups with 3-D Secure and webhooks
3. Digital Pass Service: Manage pass catalog, pricing, and entitlements; on purchase, deduct QAR/points and issue a secure digital credential (QR/NFT/barcode) with validity rules (time-limited or unlimited)
4. Earn Rules Engine: Trigger point accrual from purchases, events, or content validation
5. Missions/Gamification Engine: Track streaks, quests, quizzes, and award points/badges
6. Family/Group Wallet Logic: Apply allowance limits, pooled balances, and child restrictions
7. API Services: Enable third-party content attribution, payment provider/bank accelerators, and co-branded campaigns. This layer also integrates with additional external systems such as national transport providers, Visit Qatar's potential white-label Ticketing & Marketplace solution, digital identity platforms (e.g., Hayya), and other government-approved service providers to support credential storage and seamless user verification
8. Ledger Update: Update wallet balance/points, tier progress, and generate confirmation back to user

Digital Wallet Redemption Flow

A total of 7 steps summarizes this high-level user journey:

1. Open Redemption Center: User browses catalog (hotels, events, retail, attractions). This catalog is dynamically powered by the Visit Qatar Marketplace, ensuring a unified inventory, partner management, and offer lifecycle across all modules
2. Filter & Select: Compare options by value (QAR/point), categories, or "For You" AI suggestions
3. Choose Payment Option: Select All Points, All Cash, or hybrid (Cash+Points)
4. Transfer/Gifting (Optional): Request/approve points from family/friends before redeeming
5. Redeem & Issue: Wallet deducts points/cash and generates e-ticket (issued through Visit Qatar's potential white-label Ticketing & Marketplace solution and integrated into the Digital Wallet), QR voucher, or merchant barcode
6. Redemption at Merchant: Present QR or offline token for scanning at POS
7. Confirmation: User receives instant confirmation, updated balance, and bonus points (if campaign active)

A total of 7 steps summarizes this high-level backend journey:

1. Rewards Catalog Engine: Publish catalog, manage eligibility, blackout dates, and inventory
2. Redemption Engine: Support All-Points, All-Cash, or hybrid redemptions; apply promotions and multipliers. All redemption calculations and point validations must connect to the centralized Visit Qatar Rewards Ecosystem ("Pearl Points") ledger to ensure unified balance management, accrual history, and campaign tracking across the platform
3. Merchant Registry: Map merchants, accepted supported payment methods (points, QAR, hybrid, passes), and settlement rules
4. QR & Token Service: Generate secure one-time QR codes and offline tokens with expiry

Classification: Internal - داخلي

5. Transfer/Gifting Service: Handle requests/approvals, provenance logs, and apply restrictions
6. Digital Ticketing (issued through Visit Qatar's potential white-label Ticketing & Marketplace solution and integrated into the Digital Wallet through defined interfaces): Issue and validate QR e-tickets/passes, enforce single-use, and update state (active → redeemed → expired)
7. Ledger Update: Deduct redeemed points/QAR, apply bonus earning if applicable, and confirm to user + merchant. Before any deduction or transfer is finalized, the system must trigger OTP (one-time password) validation or equivalent secure confirmation to verify user authorization and prevent fraudulent or unintended transactions

Spending insights and dispute flow

A total of 9 steps summarizes this high-level user journey:

1. Wallet Insights Dashboard: Open wallet to view spending insights and see total points earned this month, QAR saved, and effective earn rate (points per QAR)
2. Location-Based Offers: Receive smart notifications as you approach certain areas (e.g., "20% off water sports for wallet users today")
3. Offer Redemption: Preview offer details, check availability, and redeem instantly or save for later
4. Suspicious Transaction Handling: Spot a duplicate or suspicious transaction in history and tap it to open the detail screen for review
5. In-App Support Chat: Start chat directly from the transaction screen with context auto-attached
6. Report an Issue: If a problem occurs, tap "Report an issue" and select a reason (e.g., duplicate, wrong amount, not me, service not delivered)
7. Upload Receipt (Optional): Attach receipt photo to strengthen the dispute claim and submit it in one tap
8. Case Tracking: Receive a case ID and monitor status inside the wallet (Submitted → Under Review → Resolved) and escalate to a human agent if the bot cannot resolve
9. Resolution & Refund: Get notified of resolution via WhatsApp/Email. Any refunded points or QAR credit appear in wallet balance

A total of 9 steps summarizes this high-level backend journey:

1. Insights Store: Aggregate data on spending, points, savings, categories, and trends and feed dashboards with real-time insights
2. Location-Based Offers Engine: Match user profile and proximity to active partner offers and push personalized deals to users
3. Offer Management: Issue offer vouchers, track redemptions, and manage expiries and reminders
4. Anomaly Detection: Identify unusual or duplicate transactions and surface issues automatically with reasons

Classification: Internal - داخلي

5. Contextual In-App Chat: Seed support chats with transaction details and provide seamless support entry points
6. Dispute Management Flow: Create case IDs for disputes and store reasons, SLAs, statuses, and apply auto-resolution rules
7. Receipt & Photo Uploads: Accept user uploads and use OCR to extract key details and attach them to cases
8. Escalation Handling: Route unresolved cases to human agents and notify users on status changes through resolution
9. Refunds & Adjustments: Post refunds or point adjustments to the wallet ledger and regenerate receipts and update insights automatically. Integrate with WhatsApp/Email to deliver real-time notifications on issue resolutions

AI Concierge & Journey Builder

AI Concierge is an enhanced entry point for users who prefer to generate or refine itineraries through conversational and prompt-based interactions. Users who prefer to browse, filter, and build itineraries manually can continue to do so through the standard Itinerary Builder module without engaging the AI Concierge. Both experiences draw on the same itinerary data model and share features such as editing, sharing, and saving.

A total of 10 steps summarizes this high-level user journey:

1. AI Concierge Setup: Input key preferences (e.g., family, accessibility, eco-consciousness, interests) and unlock a personalized journey builder beyond simple Q&A
2. Interactive Experience Feed: Save Itinerary and manage multiple plans. View unique experiences tailored to profile (e.g., family-friendly museums, shaded souqs) and view itinerary on a map with pinned POIs
3. What-If Scenarios: Test alternatives (e.g., “What if I travel with a toddler?” or “What if it rains?”) and instantly recalculate itinerary
4. Environmental Impact Tracking: Show quantified carbon scores and suggest eco-friendly swaps (e.g., metro vs. taxi)
5. Immersive Stories On-Site: Use GPS to trigger narrated experiences (e.g., guided walks through Souq Waqif or The Pearl)
6. Reservation: Book or reserve via WhatsApp CTAs (pre-filled messages) or other integrated booking channels
7. Accessibility Options: Adapt route with practical features: shaded paths, wheelchair-friendly attractions, low-mobility pathways
8. Real-Time Journey Adaptation: Adjust route dynamically and suggest breaks or shortcuts if user feels fatigued or route is too long
9. Persona Badges & Sharing: Document the journey with auto-generated daily logs, receive a personal travel persona badge (e.g., Culture Explorer) share badge on social platforms post-trip,

Classification: Internal - داخلي

explore trending or most-saved itineraries, and see badges like “Most Shared” or “Top Cultural Route”

10. Feedback & Future Suggestions: Provide feedback on experiences and unlock future journey suggestions based on evolving preferences

Personalized Itinerary & Recommendation Engine Flow

A total of 10 steps summarizes this high-level backend journey:

1. Profile Setup & Context Token: Store profile details (family, accessibility, eco-interests, consent) and generate a personalized context token to tailor experiences
2. Profile & POI Matching: Support multi-plan saving, and cross-device sync. Match user profile with POIs (points of interest) and event catalogs, apply real-time availability and signals (e.g., weather, crowd), and rank results through the recommendation engine. Integrate metro and Karwa datasets to enrich POI routing
3. User Toggles & Simulations: Allow user to adjust preferences (e.g., toddler mode, rain, budget), run simulations through the itinerary engine, and instantly recalculate alternative plans with time and cost tradeoffs
4. Environmental Impact Tracking: Estimate CO_2 emissions for all itinerary legs, compare against benchmarks, and suggest actionable eco-friendly swaps (e.g., metro vs. taxi)
5. GPS Geofencing & Narration: Detect arrival at points of interest and prefetch audio and auto-play localized narrated experiences
6. Partner booking system: Connect to partner booking system, WhatsApp Business APIs, and log confirmations into itinerary engine
7. Accessibility & Environmental Metadata: Integrate accessibility data (heat, shade, mobility options) and create low-effort, inclusive, shaded route suggestions
8. Telemetry Monitoring: Track trending itineraries, badges, reviews and sharing features and track pace, environment, delays, and fatigue, and propose real-time adjustments (e.g., café breaks, rerouted shortcuts)
9. Trip Data Analysis: Analyze visited sites, travel modes, eco-choices, cluster behavior into personas, and render dynamic badges for social sharing
10. Feedback & Machine Learning Updates: Ingest ratings, free-text feedback, and eco-reflections, update analytics and machine learning models, and provide partner reports with actionable improvement insights

1.2. Functional Requirements

Modules 3 and 4 are structured into Current Scope (features already scoped and planned) and Additional Scope (future enhancements). Modules 1 and 2 are presented as a single scope.

Classification: Internal - داخلي

1.2.1. Module 1 – AR navigation & wayfinding

Inter-Agency Alignment and Shared Infrastructure:
The AR Navigation & Wayfinding module developed under Visit Qatar will act as the shared backbone for government entities requiring AR-based navigation at public venues and events. Visit Qatar's system will expose secure APIs or SDKs that allow authorized entities (e.g., MoC) to integrate AR wayfinding features within their own mobile environments. This ensures technology reuse, consistent visitor experiences, and avoids duplication of development across ministries.

User A – Solution Owner (Administrator)

The Solution Owner should be able to:

1. Define and maintain the priority venue list for navigation rollout (e.g., airport, major museums, large event venues, high-footfall outdoor areas such as the Corniche and Doha Port etc.), with the ability to expand the list over time as new venues, routes, or event sites are onboarded through a configurable, scalable module framework
2. Configure AR navigation algorithms to support personalized route suggestions based on visitor profiles (e.g., interest type, trip purpose) and accessibility needs (e.g., step-free, wheelchair, stroller, etc.)
3. Define and approve event-specific customization requirements (e.g., themes, POIs, challenges, media, etc.)
4. Approve and oversee mapping data integration with third-party AR/mapping technologies (e.g., ARKit, ARCore, indoor/outdoor positioning systems), while technical integration activities are performed by the appointed vendor or DTO technical team to ensure quality and security compliance
5. Design indoor/outdoor positioning strategies (e.g., beacon placement, marker deployment, integration with venue infrastructure) to achieve high accuracy.
6. Oversee multilingual AR navigation capabilities to serve diverse tourist segments, ensuring availability in major international languages
7. Coordinate with venue operators to obtain up-to-date maps, layouts, and points of interest (POIs), and approve proposed changes before deployment
8. Define operational KPIs (e.g., Daily Active Users of AR Navigation, Path Completion Rate, Accessibility Route Usage %, Average Session Duration, Satisfaction Rating) and configure monitoring parameters for continuous performance tracking
9. Monitor navigation analytics (e.g., path completion rates, most-used routes, adoption of accessibility features) to identify and implement service improvements
10. Enforce national accessibility standards across all routes and verify compliance before publishing to the public
11. Integrate public transportation options into routing suggestions where relevant, in collaboration with government entities. Technical integration of transport or external APIs is executed by the appointed vendor or DTO team under Solution Owner approval
12. Collaborate with event organizers to ensure AR navigation covers seasonal or recurring events (e.g., F1, AFC) with the ability to reactivate prior event routes for early visitor engagement

Classification: Internal - داخلي

User B – Government Entities

Government entities should be able to:

1. Provide official accessibility guidelines and design standards to ensure compliance across all AR navigation features
2. Supply verified public transportation datasets (e.g., bus routes, metro maps, service schedules, etc.) for integration into the navigation module
3. Approve AR overlay designs and route data for government-managed facilities, ensuring accuracy and compliance with security standards
4. Validate AR navigation paths for cultural sensitivity, security considerations, and emergency access routes
5. Monitor compliance with national digital accessibility regulations and issue improvement recommendations to the Solution Owner

User C – Attraction/Venue Operator

Attraction/Venue Operators should be able to:

1. Submit detailed indoor and outdoor maps and layouts, including all levels, sections, facilities, and service points, in the required digital formats for AR integration
2. Provide real-time updates on closures, construction, and route changes to maintain navigation accuracy
3. Identify key points of interest (e.g., exhibits, stages, restrooms, customer service, etc.) for inclusion in AR overlays. Provide accurate indoor and outdoor POIs, ensuring both building interiors (e.g., stadium sections, museum floors, etc.) and external public areas (e.g., Corniche, Doha Port, etc.) are covered
4. Install and maintain physical AR markers/ beacons within venues to ensure accurate indoor and outdoor positioning
5. Validate mapped AR navigation routes to ensure accuracy and suitability for their venue layout
6. Provide accessibility details for venue-specific constraints and suggest alternative step-free or accessible routes
7. Report AR navigation issues through a structured issue management channel, coordinating resolution with the Solution Owner

User D - Service & Technology Partners

Service & Technology Partners should be able to:

1. Integrate AR navigation SDKs that function seamlessly on both iOS and Android devices
2. Design backend systems/ models with a stable core foundation and modular architecture, enabling event-specific customizations while ensuring system performance without requiring full rebuilds
3. Deploy a dynamic AR builder that enables the Visit Qatar Team to self-manage POIs, images, AR challenges, and markers

Classification: Internal - داخلي

4. Provide indoor and outdoor positioning technologies with sub-meter accuracy and low-latency updates (e.g., BLE beacons, UWB, WiFi RTT, or equivalent)
5. Enable seamless AR rendering of directional overlays, labels, and distance indicators in camera view
6. Maintain reliable cloud infrastructure for map hosting and content delivery with high uptime SLAs (99.9%)
7. Support offline AR map caching to ensure uninterrupted service in areas with limited network connectivity
8. Enable real-time path recalculation when users deviate or routes are obstructed
9. Ensure compatibility with accessibility rendering modes (e.g., larger indicators, color contrast adjustments, etc.)

User E - Visitors (Tourist & Local)

Visitors should be able to:

1. Browse AR navigation-enabled venues and routes before visiting (e.g., AFC stadiums, the F1 circuit, Doha Jewelry Expo, etc.) clearly marked with an "AR Navigation Available" badge
2. Add AR navigation routes for selected venues/ events (e.g., Souq Waqif Festival stage area, Katara Amphitheatre, etc.) to itineraries for preloading before visits
3. Receive proximity-based alerts, when the app is closed, when approaching a planned AR stop, with a deep link that opens the map at the correct location and readies AR mode
4. Launch AR navigation to follow immersive overlays (e.g., arrows, labelled landmarks, contextual tips, distance markers, etc.) with options to select wheelchair or stroller-friendly routes. Visitors should be able to navigate seamlessly across both indoor and outdoor POIs with consistent AR overlays
5. Receive seat-specific AR guidance for ticketed events (e.g., AFC matches, concerts, etc.) via push notification shortly before start time, launching aisle markers and entrance cues
6. Update navigation preferences (e.g., step-free routing) in profile so AR guidance automatically reflects these choices
7. Receive live route updates for temporary closures, diversions, or crowd redirections, with paths recalculated while maintaining AR overlays
8. Submit quick on-route feedback (e.g., "route blocked," "marker missing") directly within the AR navigation view to improve accuracy for future visitors

1.2.2. Module 2 – Gamified tours

User A – Solution Owner (Administrator)

The Solution Owner should be able to:

1. Design and approve themed tour concepts (e.g., cultural heritage hunts, food trails, family adventures, etc.), aligning them with national tourism campaigns and seasonal events
2. Develop AR puzzle and clue logic with technology partners, ensuring compatibility across devices and smooth gameplay

Classification: Internal - داخلي

3. Configure AI recommendation engine to suggest gamified tours based on user preferences, weather conditions, and real-time events
4. Define challenge tiers (i.e., beginner, intermediate, expert) and point systems to balance difficulty and engagement
5. Manage leaderboard and rewards (including settings and criteria setting) for competitive play, including in-app badges, vouchers, and partner-sponsored prizes
6. Oversee seasonal updates and special-edition games linked to recurring events (e.g., F1, annual festivals, etc.)
7. Define, track, and monitor operational KPIs (e.g., participation rate, completion rate, leaderboard activity, reward redemption, etc.)
8. Monitor player analytics (e.g., avg. time spent on app, completion times, popular challenges, etc.) to refine gameplay
9. Coordinate with partners for prize fulfillment, ensuring reward redemption alignment with the Digital Wallet program

User B – Government Entities

Government entities should be able to:

1. Review and approve game content for cultural appropriateness, educational value, and alignment with national tourism objectives
2. Recommend culturally significant sites for inclusion in challenges
3. Approve prize types and distribution rules in compliance with national gaming and promotional regulations
4. Support public-space activations by facilitating event permits linked to gamified tours
5. Provide safety and crowd management guidance for high-participation game events

User C – Attraction/Venue Operator

Attraction/Venue Operators should be able to:

1. Create location-specific challenges and trivia based on their attractions
2. Provide real-time access data for attractions included in tours to prevent routing players to closed locations
3. Offer venue-specific rewards (e.g., discounts, samples) for on-site challenge completion
4. Coordinate with the Solution Owner to position AR markers/ geofenced triggers at the venue
5. Train on-site teams to assist participants with game features and boost engagement
6. Monitor attendees' movement during events and generate reports on visitor feedback and operational impacts (e.g., queues, wait times, staffing)

User D - Service & Technology Partners

Service & Technology Partners should be able to:

Classification: Internal - داخلي

1. Deploy and maintain AR gaming engines that enable clue-based navigation, puzzle solving, and real-time scoring
2. Enable geofenced triggers to activate challenges within defined geographic zones
3. Configure multiplayer modes for group participation and team-based competitions.
4. Support disconnected mode with auto-resume and queued sync on reconnection
5. Integrate anti-cheating mechanisms (e.g., GPS spoofing detection, challenge completion verification)
6. Provide adaptive cross-device performance optimization across different mobile tiers

User E - Visitors (Tourist & Local)

Visitors should be able to:

1. Browse itineraries with clear "AR Challenge Available" tags to preview activities on their route and instantly join live, event-linked quests (e.g., AFC Trophy Hunt, F1 Speed Trail, National Day Heritage Quest, etc.)
2. Find location-aware AR overlays framed as clues or riddles (e.g., Find the building with the tallest minaret in the area, etc.), which might include visual hints, proximity meters, and directional cues
3. Navigate using floating AR markers that guide them through streets/ indoor venues, dynamically adjusting as they move to the next challenge location in the tour
4. Scan AR markers or objects using their device camera to trigger animations/ unlock hidden content
5. Collect tiered rewards (e.g., award points, virtual badges, digital tickets enabled via integration with the potential Visit Qatar's white-label Ticketing & Marketplace solution, etc.) and leaderboard boosts that scale with performance and challenge complexity
6. Progress through stages that unlock the next clue automatically, with difficulty ramping up via longer paths, trickier riddles, and advanced AR interactions
7. Track real-time standings and progress, and receive instant in-app confirmation when rewards are achieved

Notes:

Gamified tours interact with Visit Qatar's potential white-label Ticketing & Marketplace solution when challenge completions trigger reward-linked ticket issuance, such as digital event tickets earned through quests. All earned rewards, including digital tickets, are processed through the Visit Qatar Rewards Program (Pearl Points) and stored within the Digital Wallet defined in Module 3. The gamification engine communicates with both the ticketing integration layer for ticket fulfillment and the Digital Wallet for unified balance and pass management. ***Modules 3 and 4*** *are structured into Current Scope (already scoped and planned for development by Visit Qatar) and Additional Scope (enhancements requested). The vendor is expected to conduct a current state assessment and build on the work completed by Visit Qatar. The vendor's work should cover both the current scope and the additional scope, based on the progress already completed across those modules by Visit Qatar.*

Classification: Internal - داخلي

1.2.3. Module 3 – Digital wallet

Overview and Phasing

The Digital Wallet module enables visitors to earn, redeem, and manage value securely across rewards, credentials, tickets/passes enabled via Visit Qatar's potential white-label Ticketing & Marketplace integration layer, and payments. Delivery follows four phased workstreams, underpinned by shared ledgers, APIs, and security:

- Phase R (MVP) – Rewards: Pearl Points earning, redemption, curated marketplace, gamification, family/group wallets, and content/ambassador rewards
- Phase I – Identity: Privacy-preserving digital credentials (e.g., Hayya, eligibility attributes) and verified identity tokens for partner journeys
- Phase T – Ticketing & Passes: Issuance, storage, validation, and lifecycle for digital tickets and venue/transport passes (QR/NFT/offline tokens)

  Note: The Digital wallet serves as the consumer-facing layer for storing, presenting, and managing digital tickets and venue/transport passes (QR/NFT/offline tokens). Ticket issuance, inventory management, and validation are provided through the ticketing integration layer, while the wallet owns the end-user experience including pass display, lifecycle notifications, and wallet-based redemption
- Phase P – Payments: Top-ups, Cash+Points, refunds to original payment method, settlement via PSPs, financial controls and compliance

The Digital wallet interfaces with external payment services through secure, third-party payment gateway service provider integrations.

Blockchain Basis: The trust and audit layer is built on Camino Network to enable transparent, interoperable multi-party interactions.

Vendor Flexibility (No Lock-In): Current rewards components may leverage Explorins; however, all components are pluggable behind Visit Qatar APIs/SDKs and smart-contract interfaces. We are not wedded to any single vendor.

Control: Visit Qatar (Solution Owner) retains ownership of product roadmap, schemas, rules, keys, data, consoles, and environments. Vendors implement behind our interfaces and must enable replaceability.

Integration with External Ticketing and Payment Services: The Digital Wallet is designed to operate as the unified consumer-facing layer (e.g., pass storage, presentation, balance management, and transaction execution) that interacts with externally provided ticketing and payment gateway services (e.g., inventory management, ticket issuance, and validation services). The wallet features referencing ticket purchasing, pass lifecycle, or payment processing are enabled through defined API and integration interfaces with external providers.

Classification: Internal - داخلي

Note: This module operates in close interaction with a separate, potential white-label Ticketing & Marketplace solution being procured by Visit Qatar.

The capabilities scoped within this module that may also be delivered through the Ticketing & Marketplace solution include the marketplace redemption catalog, voucher fulfilment, partner onboarding, and aspects of digital pass lifecycle management. Where such capabilities are provided through the Ticketing & Marketplace solution, the Bidder shall integrate with that solution rather than develop these capabilities independently. The final allocation will be validated during the Discovery phase.

Other capabilities fall outside the scope of this module and are delivered exclusively through the Ticketing & Marketplace solution. These include ticket purchasing, digital pass issuance, payment processing for ticketed transactions, and inventory and availability queries. The Bidder shall consume these capabilities through defined integration interfaces and shall not develop equivalent functionality within the IVA Digital Wallet.

Current Scope

User A – Solution Owner (Administrator)

Earning (Phase R – MVP)

1. Define, approve, and configure Pearl Points earn rules, including bookings, tickets scans for tickets issued through Visit Qatar's potential white-label Ticketing & Marketplace solution and integrated into the Digital Wallet through defined interfaces, event attendance, and partner purchases, as well as digital passes, including time-limited/unlimited passes, catalog content, bundled POIs/events, pricing (QAR/Points/Cash + Points), validity/entitlement rules, and blackout dates
2. Define and approve post-purchase usage monitoring of digital passes; track scans/entries across venues; view usage analytics; configure partner payout rules where compensation depends on usage
3. Approve and configure event-based earning rules, missions, and content attribution

Interoperability (Phases I/T/P)

4. Configure cross-program transfer rules (eligibility, limits, fees) to allow point movement between external loyalty ecosystems, ensuring compliance and fraud prevention

Gamification (Phase R – MVP)

5. Approve booking-linked quests, badge tiers, and content-based reward campaigns
6. Approve influencer/ambassador reward allocation with audit trails

Redemption (Phase R – MVP)

Classification: Internal - داخلي

7. Approve and maintain a curated Marketplace redemption catalog (hotels/priority partners) and voucher products
8. Publish partner “cards” (barcode/ID) when provided by partners

Dashboards & Governance (Phase R – MVP)

9. Configure wallet home: balances, recent earn/redeem history, transaction log with filters
10. Manage user transaction history views
11. Define operational KPIs (points issued vs redeemed, redemption categories, QAR equivalent, partner activity) and monitoring parameters
12. Monitor centralized insights (points issued, QAR redeemed, categories, partner activity)

Additional Scope (Phase I/T/P – Future Enhancements)

1. Define QAR top-up rules and bonus campaigns
2. Configure multi-tier loyalty (Bronze → Platinum) with benefits and bank partnerships.
3. Integrate bank-card promotional offers and cashback at checkout
4. Configure Points-to-Cash conversion and caps
5. Integrate the wallet with the external VQ ticketing integration layer and broader marketplace systems (e.g., transport, retail and events) to enable ticket purchases, wallet managed refunds, and application of eligibility rules, blackout periods, inventory checks and Cash plus Points logic. The integration should maintain real time alignment of wallet balances with transactions processed through the ticketing integration layer, enforce tier based access rules before purchase, and provide direct access to purchased tickets within the wallet as the primary entry point
6. Define expiry rules for points and reminders
7. Approve location-based offers and contextual nudges (“Only 300 pts to Gold”)
8. Define randomized rewards (e.g., geofenced instant vouchers)
9. Approve/manage family/group wallet policies (allowances, pooled balances, redemption controls)
10. Approve/manage peer-to-peer gifting/transfers (fees, limits, restrictions)
11. Launch/govern gamification campaigns (missions, streaks, seasons) with opt-in privacy
12. Manage smart notifications (expiry, mission reminders, streak protection) with privacy controls
13. Approve AI/ML personalization models for offer recommendations. Visit Qatar will also explore the use of an AI Personalization and Profile Service to enhance user targeting and contextual recommendations
14. Ability to allow connection through MCP protocol to allow downstream content

Note: Integration features and scenarios related to tickets issued through Visit Qatar’s potential white-label Ticketing & Marketplace solution and integrated into the Digital Wallet, such as ticket date changes and ticket design requirements, will be detailed during discovery, including feature requirements, rules alignment, and rollout sequencing.

User B – Government Entities

Classification: Internal - داخلي

Governance

1. Review and approve wallet policies and operations to ensure compliance with consumer protection, data privacy, and in alignment with standards
2. Provide datasets for government-linked services (e.g., travel, hotels and transport)

User C – Attraction / Venue Operators

Earning (Phase R – MVP)

1. Tag event participation and purchases to trigger point accrual (“visit-to-earn”)
2. Accept/validate digital passes via QR/NFT/barcodes
3. Access pass usage logs and reconcile entitlements (entries, limits, expiry)

Gamification (Phase R – MVP)

4. Run in-venue ambassador/content and similar campaigns linked to brand visibility

Redemption (Phase R – MVP)

5. Confirm redemptions manually or via voucher codes – physical and online frequent flyer concept card which can be scanned

Governance (Phase R – MVP)

6. Maintain offer content; comply with accessibility/cultural guidelines and any other rules and regulations for offers

(Phase I/T/P – Enhancements)

7. Accept wallet payments across QAR, Points-to-Cash, and Cash+Points via QR and offline tokens
8. Upload/maintain voucher & ticket inventory, managed through the ticketing integration layer, for redemption

User D – Service & Technology Partners

Earning / Gamification (Phase R – MVP)

1. Build APIs for content-based reward attribution; support pooled wallets where applicable
2. Implement the gamification engine (missions, leaderboards, surprise rewards)

Redemption (Phase R – MVP)

3. Develop offline QR token generation and reconciliation services

Classification: Internal - داخلي

4. Build a scalable Marketplace with partner onboarding APIs

Dashboards & Governance (Phase R – MVP)

5. Integrate with campaign rule setups to align rewards and engagement
6. Automate loyalty core engines (tier calculation, expiry tracking, notifications)
7. Maintain SOC2 & PCI-DSS compliance
8. Maintain Web3 Compliance
9. Service SLA should be 99.9%
10. Integrate with channels (WhatsApp, Email) for notifications

Ownership, Replaceability & Blockchain (Applies to All Phases)

11. Implement behind Visit Qatar APIs/SDKs and Camino Network contracts; where Explorins or other providers are used, they must be substitutable without app rewrites
12. Enforce OTP for sensitive, value-reducing actions; provide runbooks and enable handover; no black-box dependencies

User E – Visitors (Tourists & Locals)

Earning (Phase R – MVP)

1. Earn points through bookings, event attendance, and purchases
2. Purchase digital passes (QAR / Points / Cash+Points)
3. Store and present passes online/offline (QR/NFT)
4. Track pass validity and get expiry reminders

Gamification (Phase R – MVP)

5. Participate in missions, streaks; earn badges and perks
6. Share approved content as ambassadors (subject to moderation)

Redemption (Phase R – MVP)

7. Browse curated catalog and redeem points for vouchers
8. Present partner cards for validation

(Phase I/T/P – Enhancements)

9. Transfer points across partner programs in real time (subject to policy)
10. Redeem in extended categories (transport, retail, attractions) with Cash+Points
11. Create shared wallets, pool balances, set allowances, and gift points

Classification: Internal - داخلي

12. Convert points into QAR vouchers/credits and spend across Marketplace
13. View tier progress (Bronze → Gold) and share badges
14. Access insight dashboards (lifetime savings, categories)
15. Initiate and track disputes (AI-assisted where available)
16. Receive real-time expiry/resolution notifications (Email/WhatsApp)
17. Link loyalty accounts for co-branded offers (where available)

Security & Refunds (Applies to All Phases)

18. Confirm value-reducing actions via OTP
19. Refund any unused cash top-up to the original payment method (subject to policy/KYC)

Implementation Note

- Phase Sequence: Launch Phase R (Rewards MVP) first; plan Phase I (Identity) and Phase T (Ticketing) tranches; introduce Phase P (Payments) enhancements as PSP certifications complete
- Blockchain: Camino Network is the canonical trust layer. Providers such as Explorins may be leveraged where they implement our interfaces; no vendor lock-in
- Control: All production keys, ledgers, schemas, rules, and admin consoles remain under Visit Qatar control. Vendors build behind our APIs and enable full handover

Notes:

The Digital wallet serves as the primary consumer-facing interface for storing, presenting, and managing tickets and digital passes made available through integrations with Visit Qatar's potential white-label Ticketing & Marketplace solution. The wallet retains ownership of the end-user experience, including pass display, balance management, lifecycle notifications, and wallet-based redemption. This module should be designed to ensure seamless handoffs between the wallet layer and the ticketing integration layer across all transaction flows.

1.2.4. Module 4 – Itinerary builder

Overview

The Itinerary Builder enables visitors to plan, edit, and share trips directly through the Visit Qatar mobile app without requiring interaction with the AI Concierge.
It provides a complementary, standalone experience for users who prefer guided or manual planning, while remaining interoperable with the AI Concierge for those who wish to switch between experiences.

Classification: Internal - داخلي

This ensures both user groups are supported:

- AI-Assisted Users: access itinerary generation through AI Concierge prompts
- Manual / Guided Users: build itineraries directly via the mobile app using baseline templates, filters, and contextual recommendations (non-AI path)

This module operates in close interaction with the AI Concierge and other recommendation engines and the potential white-label Ticketing & Marketplace solution being procured separately by Visit Qatar. As part of this module, the Bidder shall integrate with Visit Qatar's existing recommendation capabilities and consume its outputs to deliver prescriptive and personalized itinerary planning in the Itinerary Builder.

The capabilities scoped within the Itinerary Builder module that may also be delivered through the Ticketing & Marketplace solution include aspects of ticketed experience surfacing within itineraries. Where such capabilities are provided through the Ticketing & Marketplace solution, the Bidder shall integrate with that solution rather than develop these capabilities independently. The final allocation will be validated during the Discovery phase.

Other capabilities fall outside the scope of this module and are delivered exclusively through the Ticketing & Marketplace solution. These include ticket purchasing for events, venues, and transport surfaced within the itinerary experience. The Bidder shall consume these capabilities through defined integration interfaces and direct users to the Ticketing & Marketplace solution where ticketed actions are required.

Current Scope

User A – Solution Owner (Administrator)

The Solution Owner should be able to:

1. Configure baseline itineraries by day count, segmented into morning, noon, and evening with estimated POI durations
2. Enable flexible itineraries (semi-dynamic) where AI builds on baselines with contextual recommendations, swaps, and add-ons, offering more adaptability than static plans accessible outside the AI Concierge
3. Approve event and attraction content for itineraries, including themed tags (e.g., family-friendly, cultural)
4. Define operational KPIs (e.g., itineraries created per user, % of flexible itineraries adopted, save/share rates, user satisfaction, etc.) and configure monitoring parameters for continuous performance tracking
5. Monitor itinerary engagement analytics (e.g., basic sharing, badges, reviews, etc.)
6. Oversee calendar-based customization, ensuring itineraries adapt to timing constraints

Classification: Internal - داخلي

7. Approve guest vs. signed-in user experiences, including multi-plan support and cross-device saving for signed-in users

User B – Government Entities

Government Entities should be able to:

1. Provide datasets for national events, POIs, and transport services (e.g., Metro, Karwa)
2. Approve itineraries that include government-managed attractions
3. Ensure compliance with accessibility, cultural sensitivity, and branding requirements
4. Endorse the integration of sustainability and inclusivity tags (e.g., eco-friendly, wheelchair-friendly) into itineraries
5. Validate social sharing, badges, and review features in alignment with the tourism strategy

User C – Attraction/ Venue Operators

Venue Operators should be able to:

1. Provide accurate POI details (e.g., timings, entry fees, location, duration, etc.)
2. Update real-time closures, availability, and offers to ensure accuracy in AI-generated itineraries
3. Provide data feeds (e.g., offers, events, real-time updates, etc.) enabling AI to enrich static itineraries with contextual and hybrid recommendations
4. Provide multimedia content (e.g., photos, descriptions, promotions, etc.) for all POIs.
5. Respond to visitor reviews and feedback, while highlighting trending itineraries that feature their venue

User D – Service & Technology Partners

Service & Technology Partners should be able to:

1. Build the itinerary engine to support flexible/semi-dynamic itineraries, generated from baseline templates but enriched with contextual recommendations, dynamic swaps, and add-ons, ensuring a balance between structured and adaptive flows
2. Develop a chat interface and replacement engine that enables card-level edits (e.g., replace an attraction, add a day, remove an item, etc.)
3. Support onboarding Q&A for preference-setting (e.g., days, interests, travel type, etc.) and integrate results with the CDP for personalized content delivery
4. Enable map enhancements, including tap-to-open POI cards and auto-suggest nearby attractions based on consented location
5. Integrate transportation APIs (Karwa, metro) into itineraries
6. Ensure backend functionality supports guest vs. signed-in sessions, including multi-plan saving and cross-device syncing
7. Implement social engagement features such as itinerary badges, basic social sharing, and user reviews

Classification: Internal - داخلي

8. Enable interoperability with a Reel Generator module, allowing itinerary content (photos, POIs, routes) to be automatically transformed into short-form videos or social media reels for promotion and sharing, subject to Solution Owner approval

User E – Visitors (Tourists & Locals)

Visitors should be able to:

1. Browse baseline itineraries by days (2-day itinerary, 3-day itinerary, etc.), with clear daypart breakdowns and estimated time per attraction
2. Access flexible/semi-dynamic itineraries that adapt baseline plans with contextual recommendations (e.g., nearby events, seasonal add-ons, dining swaps, etc.), offering more adaptability than static options without fully dynamic recalculation without needing to enter the AI Concierge
3. Edit, replace, or remove itinerary items; add days or adjust start time
4. Save itineraries to their profile and access them across devices
5. View itineraries on an interactive map with pinned POIs
6. Use WhatsApp integration for reservations with pre-written booking texts and other Call to Actions (CTAs)
7. Share itineraries on social media (e.g., Instagram, links, etc.) and explore trending or most saved badges
8. Leave reviews on itineraries and POIs to guide future visitors

Additional Scope

These requirements extend the Current Scope by introducing new features and compliance layers. They do not duplicate the existing scope but expand it through:

- Persona badges, eco-reflections, and collaborative trip journals (beyond basic reviews/ sharing)
- Stronger compliance across accessibility, sustainability, and data governance.
- New experimental and technical enablers such as the “what-if” simulator, walking documentaries, carbon footprint engine, telemetry-driven rerouting, and trip journaling

User A – Solution Owner (Administrator)

The Solution Owner should be able to:

1. Approve “What-if” simulator scenarios (e.g., toddler travel, budget limits, rainy weather, etc.) and monitor their adoption
2. Define inclusivity policies and enforce accessible itinerary standards (e.g., wheelchair-friendly, shaded routes, family-friendly, etc.)
3. Curate GPS-triggered walking-documentary content in collaboration with local storytellers and approve scripts/narrations before publishing

Classification: Internal - داخلي

4. Approve sustainability rules for carbon footprint estimates, eco-reflections, and eco-friendly swap options
5. Define logic for generating post-trip persona badges and approve visual templates
6. Enable and approve templates for collaborative trip journals, ensuring content moderation, formatting, and brand alignment for shareable outputs
7. Monitor adoption metrics to refine personalization strategies
8. Oversee governance of data consent and preference storage (e.g., family, eco, accessibility, interests)

User B – Government Entities

Government Entities should be able to:

1. Provide accessibility standards and inclusivity datasets for itinerary routing
2. Supply eco-benchmarks and guidelines for carbon footprint calculations
3. Validate “What-if” itineraries and walking-documentary content for cultural and national branding compliance
4. Endorse persona badge categories to ensure alignment with national tourism positioning
5. Issue national data protection and privacy guidelines for storing and processing visitor preferences
6. Validate environmental and social impact reporting from aggregated eco-reflections and analytics

User C – Attraction / Venue Operators

Venue Operators should be able to:

1. Tag POIs with accessibility attributes (e.g., wheelchair access, stroller-friendly, shaded areas, etc.)
2. Contribute cultural stories, narratives, or audio content for walking-documentaries
3. Share real-time POI data (e.g., crowd levels, events, eco-certifications, temperature/shade) to support itinerary recalculations
4. Provide attribute tags for POIs (e.g., luxury, cultural, adventure, etc.) to feed into persona badge logic
5. Offer contextual promotions linked to itineraries (e.g., family bundle discounts if their attraction is included)

User D – Service & Technology Partners

Service & Technology Partners should be able to:

1. Build the “What-if” simulator that enables instant recalculation of itineraries when toggling scenarios
2. Implement accessibility-aware routing using GPS, POI metadata, and environmental factors (e.g., heat, shade, etc.)

Classification: Internal - داخلي

3. Develop GPS-triggered walking-documentary system with localized audio narration, offline caching, prefetching, and validated GPS trigger accuracy
4. Build carbon footprint engine that estimates impact per trip, integrates eco-reflections, and suggests eco-swaps (e.g., metro instead of taxi)
5. Generate persona badges post-trip and integrated with social media APIs for instant sharing
6. Provide backend analytics for Solution Owner to track engagement with sustainability, accessibility, and gamification features
7. Develop and maintain the trip journaling system, including daily auto-log generation, media upload, cloud sync, and export to shareable story formats (e.g., interactive link, PDF, etc.)
8. Maintain scalable cloud infrastructure capable of handling real-time itinerary recalculations for high user volumes
9. Implement telemetry monitoring (e.g., location, pace, fatigue/delays) and propose just-in-time rerouting (e.g., café breaks, shortcuts, etc.)
10. Update ML models with user feedback and provide improvement reports. Ensure continued interoperability with external creative modules such as the Reel Generator, allowing visual outputs from itineraries to be transformed into media for marketing or sharing purposes. (Extension of point 7 requirement)

User E – Visitors (Tourists & Locals)

Visitors should be able to:

1. Use “What-if” simulator to toggle scenarios (e.g., toddler mode, eco mode, rainy day) and instantly see recalculated itineraries
2. Receive itineraries optimized for accessibility (e.g., wheelchair-friendly, shaded routes, low-mobility, etc.)
3. Experience walking-documentaries with GPS-triggered narration by locals, creating immersive cultural tours
4. View their itinerary’s estimated carbon footprint and receive suggestions for greener alternatives
5. Select eco-friendly itineraries and receive recognition badges for sustainable travel choices
6. Document the journey with auto-generated daily logs, enriched with group notes and photos, compiled into a polished, shareable story at trip’s end
7. Earn post-trip persona badges (e.g., Culture Explorer, Adventure Seeker, Luxury Traveler, etc.) based on itinerary history and social media sharing
8. Receive trending itineraries, contextual recommendations, and nudges during their trip
9. Adapt journeys in real time with fatigue/delay detection (e.g., café breaks, shortcuts) suggested automatically
10. Contribute eco-reflections and feedback post-trip to unlock improved and personalized future itineraries
11. Discover an interactive feed of experiences tailored to their profile before starting their journey

Implementation Note

The Itinerary Builder module operates as a dual-path system:

Classification: Internal - داخلي

- Standalone / Non-AI Path: Directly accessible from the mobile-app homepage, allowing users to browse, filter, and build itineraries manually
- AI Path (Integrated Journey Builder): Accessed via the AI Concierge for fully dynamic AI-generated journeys

Both paths share a common backend to ensure synchronized itineraries, shared preferences, and future features like reel generation and eco-tracking. This guarantees a consistent experience for AI and non-AI users alike.

1.3. Integrations

The Smart Solution should provide bilateral APIs between entities to enable connectivity between the Smart Solution and entity-specific integration platforms. Potential integrations include but are not limited to the following:

- Ministry of Transport – Public Transport APIs: To integrate metro, bus, taxi, and ferry schedules, routes, service updates, and ticketing options (integrated via the potential Visit Qatar Ticketing Integration Layer) into navigation features
- Ministry of Interior – Security & Entry Systems: To validate visitor entry permits, visa details, and event-specific access requirements
- Hamad International Airport – Flight Information Display Systems (FIDS): To provide real-time arrival/departure data, gate locations, and navigation from arrival halls to transport connections
- Mowasalat – Ride-Hailing & Fleet Dispatch APIs: To enable booking, fare estimates, and vehicle tracking directly from the app
- Qatar Rail – Metro Operations Systems: To display live metro arrival times, station facilities, and indoor and outdoor navigation within stations
- Event Management Platforms (e.g., F1, FIFA Legacy, Expo): To access event schedules, seating maps, ticketing status (integrated via the potential Visit Qatar Ticketing Integration Layer), and AR wayfinding inside venues
- Museum & Attraction Ticketing Systems (integrated via the potential Visit Qatar Ticketing Integration Layer): To allow ticket purchase, QR code storage in the Digital Wallet, and real-time capacity updates
- Hospitality & Booking Platforms (Hotels, Tours, Experiences): To integrate booking confirmations, room check-in details, and recommended nearby attractions
- Telecommunications Providers – eSIM Provisioning Platforms: To activate, manage, and top-up eSIM profiles directly through the Digital Wallet
- Food Delivery & Restaurant Reservation Platforms: To integrate dining options, menus, and booking for gastronomy-based tours or rewards programs
- Payment Gateways & Banks – Financial Transaction Systems: To process secure payments for tickets (issued through the potential Visit Qatar Ticketing Integration Layer), passes, and partner services

Classification: Internal - داخلي

- Municipality & Heritage Authorities – Cultural Content Portals: To validate and approve AR cultural narratives and heritage site information
- Weather Data Providers: To display live weather forecasts and alerts for itinerary adjustments
- Accessibility Data Sources: To integrate verified accessibility routes, facilities, and step-free navigation details
- Partner Loyalty & Rewards Platforms: To enable redemption of offers, vouchers, and discounts through the Digital Wallet
- Visit Qatar's potential Ticketing & Marketplace solution: To enable end-to-end integration with the external ticketing and marketplace solution, which Visit Qatar is evaluating as a potential white-label offering, for ticket purchasing, digital pass issuance and validation, inventory synchronization, wallet-based payment processing, and redemption workflows, ensuring coherent frontend and backend delivery across all modules interfacing with the external Ticketing & Marketplace integration layer, with integration readiness criteria defined during discovery and validated through joint testing prior to production release. Where this capability is delivered by the potential white-label Ticketing & Marketplace solution, the Bidder shall integrate with that solution rather than develop the capability independently.
- Ministry of Municipality (Geographic Information Systems Center - CGIS) - Geospatial Data and Address Services: To integrate CGIS-owned APIs and data services for landmark search, address location, and geospatial accuracy, and to leverage the Inwani national address geodatabase for building-level geocoded address resolution across AR navigation, POI management, and itinerary features, where applicable.

Classification: Internal - داخلي
